Build a CI/CD pipeline

Table of Contents

Prerequisite: 3
Walkthrough: 3
Part 1: Implement simple CI/CD Pipeline 3

In this activity, you will implement a CI/CD pipeline using GitHub Actions — one of the most accessible tools for introducing DevOps concepts. You'll start with a basic static website (HTML files) and automate the process of validating, packaging, and deploying it to GitHub Pages.
The pipeline will include five stages that reflect key DevOps practices: code checkout, syntax validation, link checking, build preview, and automated deployment. By completing this activity, you'll get hands-on exposure to continuous integration and delivery, version control workflows, and automated quality checks — core pillars of DevOps.
This activity demonstrates how even a static site can benefit from DevOps automation, setting the stage for scaling these practices to more complex applications and cloud-native deployments.

Prerequisite:

- GitHub Account (https://github.com/login)

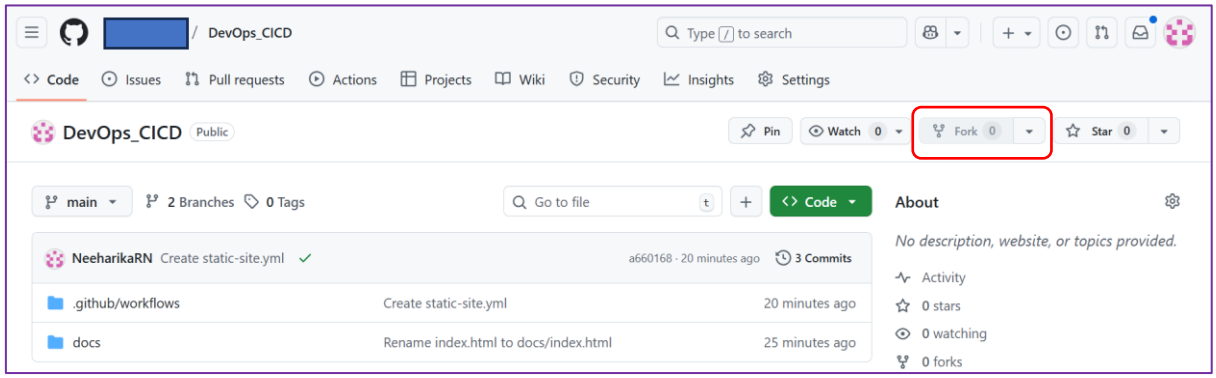
Walkthrough:

a) Implement simple CI/CD Pipeline

Part 1: Implement simple CI/CD Pipeline

1

Navigate to the repository provided by trainer & fork it.

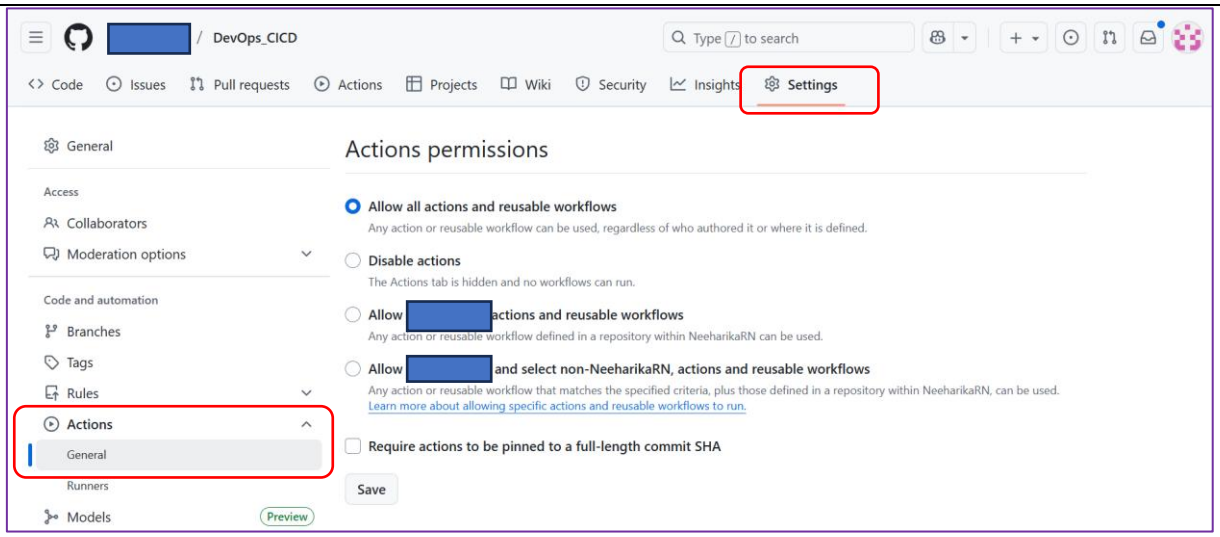


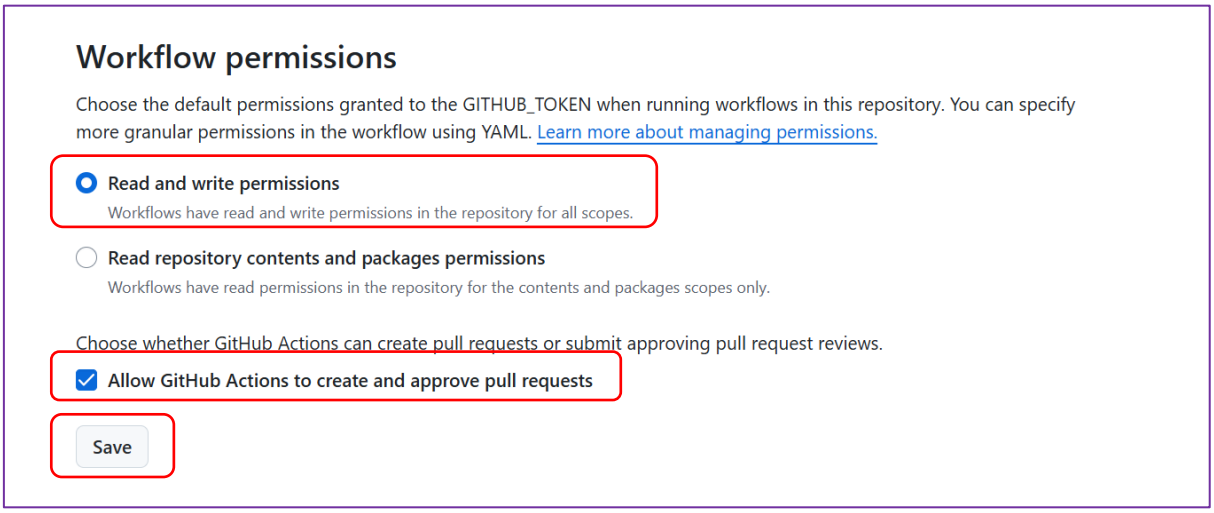
Navigate to "**Settings**".

In the left panel, click on "**General**" under "**Actions**".

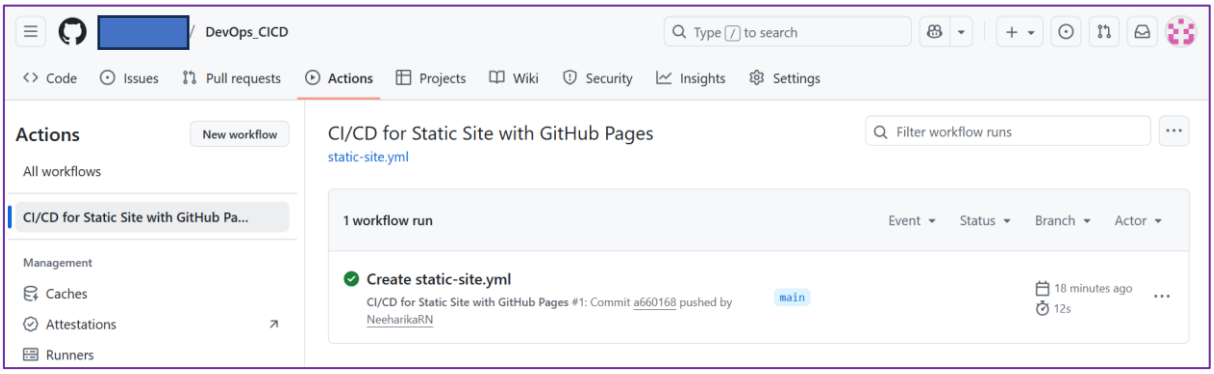
Scroll down to the "**Workflow Permissions**", Select "**Read and write permissions**" and check the box "**Allow GitHub Actions to create & approve pull requests**".

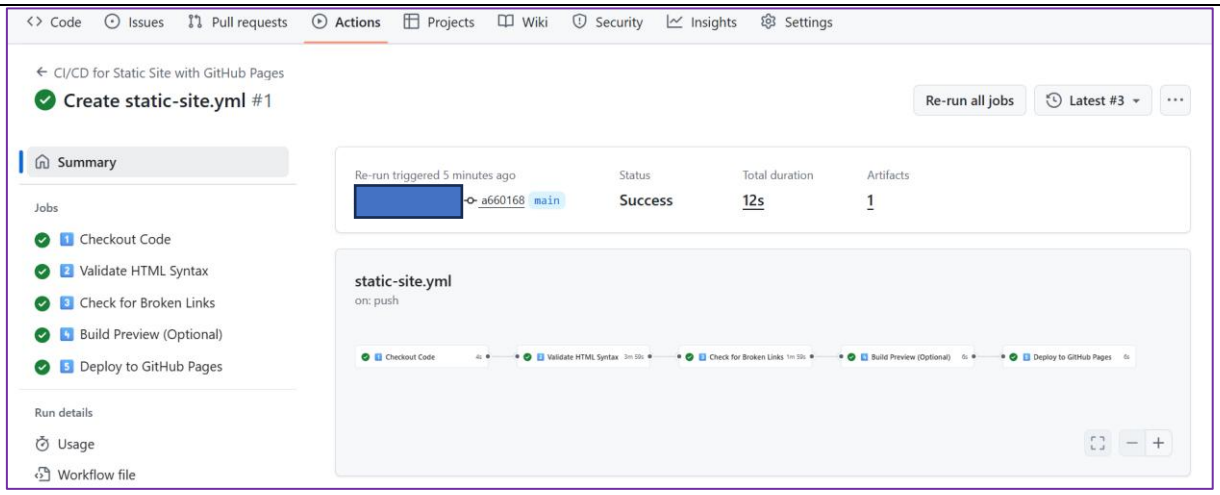
Click on "**Save**".



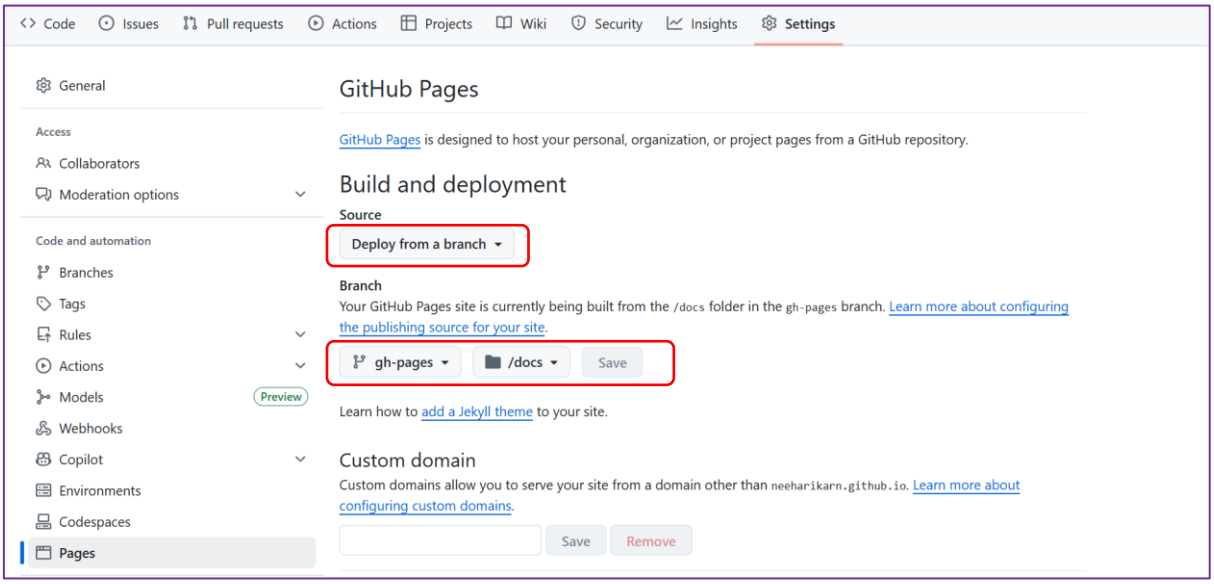


After successful fork, check if the workflow was executed. If not, perform a small edit (like adding a file) and then observe the "**Actions**" tab.





Navigate to "**Settings**" and from left panel, select "**Pages**". Under "**Build and Deployment**", select "**Deploy from a branch**". Under branch, select "**main**" and "**/docs**". Click on "**Save**".



After few minutes, you will get your site URL. Click on "**Visit site**" and view the website.
